The Bachelor of Science in Biology degree program is designed to educate students about the world of living things through a broad-based biology curriculum. Students will take courses in biology, ecology, cell and molecular biology, and animal/plant physiology. Other required courses include general chemistry, organic chemistry, physics, and calculus. The two options within the Biology degree allow students to tailor their degree to their specific interests. In addition to a strong knowledge base in biology, students will gain critical thinking, teamwork, and communication skills.

Penn State Berks offers two options within the Biology degree to allow students to pursue specific career paths: the General Biology Option and the Genetics and Developmental Biology Option.

**General Biology Option**
This option provides a broader biology curriculum, allowing students to study a wide variety of biological disciplines, including plant pathology, ecology, physiology, genetics, and evolutionary biology. This option helps to prepare students for careers in health-related professions, and environmental and government agencies. Students may also choose to enroll in graduate and professional school. Undergraduate research opportunities in the General Biology Option are available in the fields of evolutionary biology and population ecology, food microbiology/toxicology, and microbial ecology.

**Genetics and Developmental Biology Option**
Students enrolled in the Genetics and Developmental Biology Option will follow a more focused biology curriculum, concentrating on biochemistry, genetics, and developmental biology. This option helps to prepare students for careers in the pharmaceutical, biotechnology, and food science industry. Students will be prepared for advanced study in medical, dental, optometry, pharmacy, chiropractic, physician assistant, genetic counseling, and veterinary programs. Research opportunities in this option include the genetics/biochemistry of bacteria, the genetic control of metabolism in *Drosophila* and the use of cell culture systems to study development and cancer.
